

Building technique

In a broad sense, building customs are a symbiosis of architecture, technique and process. At danskbyggeskik.dk, the prime focus is on building technique, followed by building process in a historical context; architecture as a phenomenon is addressed in other professional media and reference works.

In the treatment of building customs associated with multi-storey construction during the period 1850-2000, distinction is made between:

- technological development
- basic types of multi-storey construction: defined by changes in building customs
- techniques and materials
- tradesmen: the various trades that have been involved

The subjects are expanded in standalone articles that can be found in the menu to the left.
